

Assignment 2

Exercise 1 – Basic (Event Bubbling)

You are building an insurance payment page. A button "Pay Premium" is inside a div "paymentSection".

Tasks:

1. Add click event to both div and button.
2. Observe and write the output order when button is clicked.
3. Mention which event phase is occurring.

main.html

```
<!DOCTYPE html>
<html lang="en">
  <head>
    <meta charset="UTF-8" />
    <meta name="viewport" content="width=device-width, initialscale=1.0" />
    <title> Insurance payment page</title>
  </head>
  <body>
    <div id="paymentSection" style="text-align: center;">
      <h3>Insurance Payment , Click on Pay button to pay</h3>
      <button id="PayPremium">Pay Premium</button>
    </div>
    <script>
      document.getElementById("paymentSection").addEventListener("click", () => {
        console.log("Insurance Payment Done");
      });
      document.getElementById("PayPremium").addEventListener("click", (event) => {
        console.log("Payment Done");
      });
    </script>
  </body>
</html>
```

Output

```
Payment Done
Insurance Payment Done
> ctrl i to turn on code suggestions. Don't show again
```

It is Bubbling phase

Exercise 2 – Basic (Event Capturing)

On a policy page, a container validates user before showing policy details.

Tasks:

1. Use capturing phase for both parent and child.
2. Ensure parent runs first.
3. Write expected console output.

exer2.html

```
<!DOCTYPE html>
<html lang="en">
  <head>
    <meta charset="UTF-8" />
    <meta name="viewport" content="width=device-width, initialscale=1.0" />
    <title> Insurance payment page</title>
  </head>
  <body>
    <div id="container" style="text-align: center;">
      <h2>Policy Details</h2>
      <button id="btn">View Details</button>
    </div>

    <script>
      let p=document.getElementById("container");
      let c=document.getElementById('btn')
      p.addEventListener("click", () => {
```

```

console.log("User validation is done and allowed");
},true);
c.addEventListener("click", (event) => {
console.log("Policy details");
},true);
</script>
</body>
</html>

```

Output

```

User validation is done and allowed
Policy details

```

Exercise 3 – Intermediate (stopPropagation)

Insurance dashboard shows policy cards. Clicking card navigates to details, but clicking delete should only delete.

Tasks:

1. Stop event bubbling on delete button.
2. Prevent navigation log from appearing.
3. Write JavaScript code

exer3.html

```

<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <title>Insurance Dashboard</title>
</head>
<body>
  <div id="policy" style="border-style: solid; width: 300px;text-align: center;">
    <h3>Health Insurance</h3>
    <button id="delete">Delete</button>
  </div>

```

```
</div>

<script>

let pol= document.getElementById("policy")

let delbtn = document.getElementById("delete")

pol.addEventListener("click", () => {
  console.log("Navigating to details page")
})

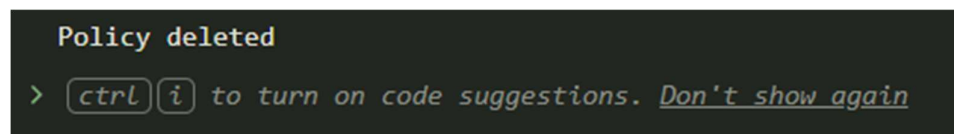

delbtn.addEventListener("click", (event) => {
  event.stopPropagation();
  console.log("Policy deleted")
})

</script>

</body>

</html>
```

Output

Exercise 4 – Intermediate (Reinforce bubbling, capturing, and stopPropagation together)

You are building an Insurance Claims Dashboard.

- Each Claim Row is clickable → Opens Claim Details page
- Inside each row there is an Approve Claim button → Approves the claim without navigation This is extremely common in insurance admin panels.

Tasks

1. Add click event on claimRow
 - Log: Opening Claim Details
2. Add click event on Approve Claim button
 - Log: Claim Approved
3. Ensure that clicking Approve Claim
 - does NOT open claim details

4. Explain:

- What happens without stopPropagation()
- What happens with stopPropagation()

exer4.html

```
<!DOCTYPE html>

<html>

<head>

  <title>Insurance Claims Dashboard</title>

</head>

<body>

<div id="claims" style="display: flex;flex-direction:column;align-items: center;">

<h1 style="text-align: center;">Claims Panel</h1>

<div id="row" style="text-align: center; border-style: solid; width: 300px;">

  <h2>ClaimId 2618 – Vehicle Damage</h2>

  <br/>

  <button id="btn">Approve Claim</button>

</div>

</div>

<script>

let panel = document.getElementById("claims")

let row = document.getElementById("row")

let btn = document.getElementById("btn")

panel.addEventListener('click', ()=>{

  console.log("validating details")

},true)

row.addEventListener("click", () => {

  console.log("Opening Claim Details")

})

btn.addEventListener("click", (e) => {

  e.stopPropagation();

  console.log("Claim Approved")

})

}
```

```
})  
</script>  
</body>  
</html>
```

Output

What happens without stopPropagation()

Without stopPropagation(), when clicked on Approve claim button , it navigates to claims details page . Approving should not navigate to claims details .

What happens with stopPropagation()

With stopPropagation it stops from navigating to claims details page when clicked on Approve claim button
